Subject: Final Letter Report

St. Louis Auto Shredding AOC Site Removal Action

National City, St. Clair County, Illinois

Technical Direction Document No. S05-0402-011

Tetra Tech Contract No. 68-W-00-129

Dear Mr. Harris:

The Tetra Tech EM Inc. (Tetra Tech) Superfund Technical Assessment and Response Team (START) is submitting four copies of the enclosed final letter report on the St. Louis Auto Shredding AOC site in National City, St. Clair County, Illinois. As requested, two of the enclosures contain both hard copies and an electronic compact disc of the analytical results and waste manifests; the additional two enclosures only contain an electronic version of the analytical results and waste manifests. If you have any questions or comments regarding the report or need additional copies, please contact me at (314) 892-6322, extension 25, or Therese Gioia at (312) 201-7431.

Sincerely,

Thomas Binz

Tetra Tech START Project Manager

1.0 INTRODUCTION

The Tetra Tech EM Inc. Superfund Technical Assessment and Response Team (START) has prepared this letter report in accordance with the requirements of Technical Direction Document (TDD) No. S05-0402-011, which the U.S. Environmental Protection Agency (U.S. EPA) assigned to START. The scope of this TDD was to provide oversight during removal actions conducted at the St. Louis Auto Shredding (SLAS) Administrative Order by Consent (AOC) site in National City, St. Clair County, Illinois. Specifically, START was tasked to conduct monitoring activities at the site and prepare this letter report.

Section 2.0 of this report provides background information on the site. Section 3.0 details the removal activities conducted by the site owner, Section 4.0 summarizes waste disposal information, and Section 5.0 summarizes this report and presents conclusions drawn from observations made during on-site monitoring activities. In addition, Appendix A contains site figures, Appendix B contains a photographic log of site activities, Appendix C contains the Manifest Tracking Log, Appendix D contains confirmatory sampling results for samples collected during removal actions, and Appendix E contains waste manifests.

2.0 SITE BACKGROUND

The SLAS site is located off State Highway 203, behind the Gateway National Golf Links golf course and across the Cahokia Canal from the International Raceway Track in National City, Illinois (see Figure 1 in Appendix A). The portion of property pertaining to this removal action, referred to as the SLAS AOC site, is an undeveloped field, 9.73 acres in size and approximately 0.75 mile north of SLAS (see Figure 2 in Appendix A).

The SLAS AOC site was previously used as an unpermitted landfill and burn site. The site was discovered in 1993 by a group of bird hunters who observed numerous overturned and open drums at the site and reported their observations to the Illinois EPA (IEPA). Later that year, a privately funded site inspection (SI) was conducted at the site. The SI report documented the presence of 27 55-gallon drums. Samples collected during the SI indicated the presence of volatile organic compounds (VOC), semivolatile organic compounds (SVOC), metals, and polychlorinated biphenyls (PCB) in the on-site 55-gallon drums. The contents of the drums were believed to be paint waste and solvents. In 1996, the drums were removed from the SLAS AOC site during a privately funded removal action.

From 1998 to 2000, several investigations were conducted at the site by various agencies, including the Illinois State Geological Survey (ISGS), the Illinois Department of Transportation (IDOT), and the IEPA. Investigations by the various agencies indicated that soils at the site were contaminated with PCBs at concentrations exceeding the Toxic Substances Control Act (TSCA) regulations. In addition, analytical results also indicated the presence of several metals, including lead, at concentrations exceeding the Tiered Approach to Corrective Action Objectives (TACO) Tier 1 soil remediation levels.

In Spring 2000, the IEPA Site Assessment Unit (SAU) in conjunction with U.S. EPA began an abbreviated site investigation. As a result of the investigation, metals and PCBs were detected near the surrounding wetlands. The IEPA SAU investigation report recommended that the site be referred to U.S. EPA for a potential removal action as well as placement into Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) database. Additional site history information is provided in the investigation report prepared by RAPPS Engineering and Applied Science (RAPPS) for SLAS.

3.0 REMOVAL ACTIVITIES

This section discusses removal actions conducted at the SLAS AOC site from May 11 through September 3, 2004. Removal actions included (1) mobilization and site setup, (2) excavation and removal of contaminated soil, (3) confirmatory sampling, (4) equipment decontamination, and (5) demobilization.

3.1 MOBILIZATION AND SITE SETUP

On May 11, 2004, an initial kick-off meeting was conducted at the site. Representatives of START, SLAS, and RAPPS were present for the meeting. During the meeting, the roles and responsibilities of all parties involved were discussed. It was determined that RAPPS would manage the removal action, conduct confirmatory soil sampling, procure any required analytical services, perform oversight on behalf of the potentially responsible party (PRP) for the site, and provide U.S. EPA with daily progress reports and a final report within 60 days after completion of the removal action. In addition, SLAS would be responsible for the excavation, transport, and disposal of contaminated soil. The U.S. EPA On-Scene Coordinator (OSC) tasked START with oversight and documentation of all removal action activities.

On May 19, 2004, RAPPS and SLAS mobilized equipment to the site and began constructing a gravel haul road between Highway 203 and the site. In addition, a decontamination area was established.

RAPPS began performing additional waste characterization sampling to further delineate soils to be transported to a local landfill, to a landfill that accepted PCB-contaminated soil, or to a PCB incineration facility for waste disposal. SLAS personnel began clearing the nonhazardous waste areas.

3.2 SOIL EXCAVATION AND DISPOSAL

SLAS personnel began excavating nonhazardous soils on June 14, 2004. Nonhazardous soils were classified as those soils with a PCB concentration of 10 parts per million (ppm) or less. Classification was based on waste profiling conducted by RAPPS. In addition, nonhazardous soils were analyzed for toxicity characteristic leaching procedure (TCLP) metals and were required to pass TCLP concentrations for all metals targeted for analysis. Nonhazardous soils were transported to the Chain of Rocks Recycling and Disposal Facility Phase 2 landfill in Granite City, Illinois, or the Roxana Landfill Authority in Roxana, Illinois, for disposal.

Excavation of nonhazardous PCB soils (special waste) also began on June 14, 2004. Special waste soils were classified as soils with a PCB concentration greater than 10 ppm but less than the TSCA regulatory concentration of 50 ppm. Classification was based on waste profiling conducted by RAPPS. In addition, nonhazardous soils were analyzed for TCLP metals and were required to pass TCLP concentrations for all metals parameters. Special waste soils were transported to the Peoria Disposal Company (PDC) Number 1 facility in Peoria, Illinois, for disposal.

Excavation of hazardous soils began on July 2, 2004. Hazardous soils were divided into two types: those to be treated and those requiring incineration. Hazardous soils for treatment were classified as soils that were analyzed for TCLP metals and failed. The soils were treated with lime prior to transport and disposal. The hazardous soils for treatment were transported to the PDC Number 1 facility in Peoria, Illinois, for disposal.

Hazardous soils requiring incineration were classified as those soils with a PCB concentration greater than 50 ppm and concentrations of naptha solvents and xylenes greater than 1,000 ppm. The hazardous soils requiring incineration were transported to Onyx Environmental Services (Onyx) in Port Arthur, Texas.

During removal action activities, RAPPS continued sampling and designating areas stockpiled with nonhazardous soils, special waste soils, and hazardous soils for treatment and incineration. Each type of soil was sampled and stockpiled based on the analytical results. Excavation of nonhazardous soils,

special waste soils, hazardous soils for treatment, and hazardous soils for incineration was completed on September 3, 2004. In addition, during the course of the removal action, the project schedule was delayed and modified due to wet weather conditions.

3.3 CONFIRMATORY SAMPLING

Following excavation of nonhazardous soils, special waste soils, hazardous soils for treatment, and hazardous soils for incineration, the entire site was sampled using a 6-foot by 6-foot grid system. Sampling was conducted in accordance with 40 Code of Federal Regulations (CFR) Part 761, Subpart O, to comply with the following cleanup goals:

Arsenic:	260 mg/kg	Barium:	67,000 mg/kg	Chromium:	450 mg/kg
Lead:	1,000 mg/kg	PCBs:	10 mg/kg		

mg/kg = Milligram per kilogram

Confirmatory sampling results are presented in Appendix D of this letter report.

3.4 EQUIPMENT DECONTAMINATION

At the completion of soil excavation, all heavy equipment used during excavation and removal action activities was decontaminated using a pressure washer and soap solution.

3.5 DEMOBILIZATION

Upon completion of soil excavation and transport and disposal in September 2004, SLAS personnel began restoration activities. Restoration activities consisted of capping the excavated areas with 10 inches of soil, over-seeding the backfilled area, and removing the haul road. Capping was completed on September 22, 2004, at which time the crew demobilized from the site.

Once capping was completed, U.S. EPA and START visited the SLAS AOC site to observe final site conditions. At that time, U.S. EPA and START observed the condition of the backfill as unacceptable. It appeared that backfill was not graded sufficiently to prevent ponding. In addition, the orange snow fence visual indicator was exposed in the central portion of the site, a majority of the site was saturated, and the northeast corner was completely under water. The U.S. EPA informed SLAS and RAPPs personnel that

backfill activities were not acceptable and additional work was required at the site before the site could be deemed complete. In addition, U.S. EPA informed SLAS and RAPPs personnel that the additional work would need to be completed as soon as weather permitted. Additional work included pumping all ponded water at the site, regrading of the site, broadcast application of straw to minimize erosion, and additional seeding. Additional activities were completed on May 7, 2005.

4.0 WASTE DISPOSAL

A total of 7,289 tons of soil were excavated from the site and transported off site for disposal. The total includes 4,880 tons of nonhazardous soils and 2,409 tons of hazardous soils for treatment or incineration. The waste disposal information is summarized in Table 1 below. More detailed waste disposal information is presented in the Manifests Tracking Log located in Appendix C of this letter report.

TABLE 1 WASTE DISPOSAL SUMMARY

Waste Type	Waste Profile	Quantity (tons)	Disposal Facility		
Nonhazardous Soils	SE1001369	2,789.0	Chain of Rocks		
	SE1001369	754.7	Roxana LF		
Special Waste Soils	10030498	1,336.8	PDC

Hazardous Soils for Treatment	10030486	1,938.9	PDC		
Hazardous Soils for Incineration	698792/PTA698972	469.8	Onyx-Port Arthur		
Total Hazardous Soil for T	2,408.7				
	7,289.2				

5.0 SUMMARY AND CONCLUSIONS

U.S. EPA tasked START to provide oversight during removal action activities at the SLAS AOC site in National City, Illinois. Excavation of soils classified as nonhazardous soils, special waste soils, hazardous soils for treatment, and hazardous soils for incineration occurred between June 14 and September 3, 2004. Nonhazardous soils were transported to landfills for disposal. Special waste soils

and hazardous soils for treatment were transported to the PDC Number 1 facility in Peoria, Illinois, for disposal. Hazardous soils for incineration were transported to the Onyx Port Arthur, Texas, facility for disposal. A total of 4,880 tons of nonhazardous soils and special waste soils were excavated and transported off site for disposal, and 2,409 tons of hazardous soils were excavated and transported off site for treatment and or incineration.

Based on site conditions after capping, additional backfill work including pumping of ponded water, regrading of the site, broadcast application of straw to minimize erosion, and additional seeding.

Additional activities were completed on May 7, 2005.

No further action is anticipated under this TDD.
